

# Envelope Moisture Management for an Affordable Housing High Rise

Francis Conlin, PE, BECxP

High Performance Building Solutions

Retrofit Conference, Charlotte, NC

October 9, 2018

# Learning Objectives

1. Forensic Moisture Assessment of an Existing Building Envelope
2. Importance of Design Review and Mockup Testing for Existing Building Retrofits
3. Key Moisture Management for PTAC systems

# Forensic Moisture Assessment of an Existing Building Envelope

Built in 1980  
7-stories with 1 story  
Community area.

Leaks at intersection

# Roof Thermography Inspection

# Inside Inspection

# Outside Inspection

## PTAC sleeve terminates inside wall

# Outside Inspection -Detail

# Water Test – DIY Spray Rack

# Inside Re-Inspection

## Leaks observed when spraying PTAC

# Outside Re-Test

## Temporary seal up PTAC & exclude window

- Still leaks!

# Outside Test Again – Window Window-Only Leaks

Additional Information:  
Thin brick cladding? Original stucco cladding?

# Test Thin Brick Clad Wall – It Leaks Too

# Review Plans – Conduct Invasive Inspection

PTAC, windows, two cladding systems all leak

# Repair Requires Removal and Recladding

## Manage moisture with a drainage shelf

# Mock Up PTAC Repair Sleeve to extend beyond the wall

# PTAC repair - Mock Up

# PTAC repair - Mock Up

# PTAC repair - Mock Up Testing

# Thank You

Francis Conlin

High Performance Building Solutions

# Bonus Round

## Case Study 2: Wet Walls Research Lab

### Research Lab Building

University owned Research facility High comfort  
office space for 500 staff

Laboratory in core with precise climate control

Electrostatic discharge controls

Located in a cold climate

High performance building = LEED Gold 2012

**Precast Concrete on a metal frame.**  
**Note the sequence of construction.**  
**I-Beams go up first, Precast gets hung**  
**off of the I Beams**  
**Then the rest of the wall assembly is**  
**built around that.**

Here are some pictures of the walls with the gypsum and insulation cut away.

On cold days water Condensed on the precast concrete walls and dripped down -

On really cold days moisture Froze on the precast concrete walls and built up for several days until a warm spell melted it all at once.

On really cold days moisture Froze on the precast concrete walls and built up for several days until a warm spell melted it all at once.

If the dripping walls were over windows this created water bubbles under the paint at the window head (15% of offices) - which then would burst and drip water all over the papers piled up on the window sills.

# Two Precast Concrete Wall Designs

**Low Risk Wall**—Impermeable face-sealed cladding (“perfect barrier”) that is internally insulated with air impermeable insulation. Typically spray applied 2 lb/ft<sup>3</sup> (0.91 kg/m<sup>3</sup>) polyurethane foam or rigid foam board directly adhered to the backside of the exterior cladding with all joints sealed.

**Failure Mode**—Convective looping of interior air between the interior and the interstitial cavity existing between the back of the cladding and the interior gypsum board lining leading to condensation, corrosion, mold, odors and generally bad things.

Could have easily installed rigid board or SPF during construction

The second design is very difficult to build. How do you tape foil faced insulation behind and around the I-Beams to make a continuous vapor or air barrier?

The second design is very difficult to build. How do you tape foil faced insulation behind and around the I-Beams to make a continuous vapor or air barrier?

Usually what happens:

IR001872.IS2

2/14/2014 7:35:46 AM

Visible Light Image

IR photos show heat signatures along the hard-to-reach I-beams areas illustrating where air leakage into the wall assembly is occurring.

**Reinsulate and monitor for the repair mock-up**

# Walls At Risk: Condensation Events Measured Temperature of PreCast Wall and Surroundings

**Condensation Events**

Condensation occurs when precast concrete is colder than cavity air dew- point. Temperature Difference (F).

Measured surface and dew point temperatures in wall cavities. Condensation occurred 46% of the time. The average precast temperature when condensation occurred was 36F; the highest precast temperature when condensation occurred was 47F.

# Insight Risky Business: High Risk Walls

An edited version of this Insight first appeared in the ASHRAE Journal.

By Joseph W. Lstiburek, Ph.D., P.Eng.,  
Fellow ASHRAE

# Thank You Again!
